

The Importance of the water Industry

The water industry is important to me because my grandpa works in the water industry. I only get to see my grandpa a few times out of the year and you never know how their weather is going to be. These men and women risk their lives to make sure people have running water. If someone's water line breaks they have to go out and fix it. These people may get called out to work when there is severe weather. Sometimes this means they get called out to work while everyone else is at home spending time with family on holidays and other special occasions.

Not all ground water is safe to drink. We are fortunate to have rural water systems that ensure clean, safe drinking water is available at the convenience of a tap.

A person can only go 3 days without water. We need it because 60% of our body is made up of water. Our body uses water to flush out our system, regulate our body temperature, and over all regulate homeostasis.

The people that these men and women work for is, you and me. We use water everyday! Almost anything we do all day uses water in some way. For example; taking a shower, brushing your teeth, using the bathroom, washing clothes, washing dishes, feeding and watering plants and animals, the list goes on. People don't think about how much water we use each day. They also don't think about how it would affect us if there was no running water for a day or even a few days.

People all over the world have grown so dependent on mechanisms to do everything for them, like dishwashers and washing machines. They wouldn't know what to do if there wasn't running water, and they needed to cook, clean clothes or to wash their dishes. That's why anyone who works in the water industry stays busy.

The water industry is so diverse that if you plan to go into the industry you can find very good jobs such as treatment services, project manager, construction, administration, and much more. The people that work in this industry are very skilled and hard working.

We need water to do everything. Water makes the world go round. We need water to grow plants to be able to feed our civilization. People need water to have a sewage system, water grass for our yards, and such. Water is so important and we don't even realize it. People need water for their animals, to be able to feed people.

This is just a few reasons why this industry is fast growing, and very important.
